Nutri-Scan Student Start Plan

A practical first 14 days for a mechanical engineering student

Prepared from the saved Nutri-Scan workspace documentation on 15 October 2026.

Document status: planning and review drafts. This PDF is not commercial, legal, scientific, regulatory or production approval.

Generated locally from Markdown and CSV source files. Refer to the source files for ongoing edits and the claims matrix before external use.

Student Founder Start Plan

Starting Nutri-Scan as a mechanical engineering student

Start as a college project with one farm—not as a full company yet.
Your first goal is to prove that the workflow is useful before spending heavily.

This plan is tailored to a mechanical engineering student at Sinhgad, Solapur.
No college endorsement, mentor, facility, funding or partnership is assumed.
The steps and 14-day target below are proposed, not completed activities.

Five practical steps

1. **Find one faculty mentor.** Show the working synthetic-data demo and ask for

guidance and farmer introductions. Ask about the college's entrepreneurship or incubation cell **if available**. Check college/institution IP rules before commercializing work or using college resources externally.

1. **Build a small team.** Use your mechanical skills for enclosure design, mounting,

sample-handling design and field usability. Look for one electronics student for sensors and one software student for the app. Do not assume a teammate or module is already available; agree small responsibilities first.

1. **Speak to three dairy farmers.** Seek introductions through family, faculty or

a local veterinarian. Use the discovery guide:

- How do you identify and check stored silage/feed?
- How do you keep photos and laboratory reports?
- Which follow-up task is regularly missed?

Listen for recent examples; do not promise better milk yield or safe feed.
Ask permission for notes and keep identifying information outside Git.

1. **Agree a small trial with one willing farmer.** Start with batch records,

evidence photos, observation-only checks and in-app reminders—not a nutrient or safety test. You do not need expensive sensors to test this workflow. Use a synthetic demo initially; real farm data needs informed permission and the technical readiness gates.
Agree who operates the app, the task being tested, duration and support.

1. **Choose hardware only after the need is clear.** Do not buy an expensive NIR

instrument now. Actual nutrient/safety claims require suitable equipment, laboratory comparisons and expert validation. The ESP32 default/emulator values are synthetic and must be labelled; never use them to fill missing farm readings.

Your next 14-day target

One mentor + two teammates + three farmer interviews + one agreed small pilot.

Proposed window	Practical outcome
Days 1–3	Show the demo to a potential mentor and ask for introductions.
Days 4–7	Recruit teammates and arrange three permissioned farmer conversations.
Days 8–14	Identify one repeated problem and agree a small pilot scope with a willing farm; document outstanding readiness gates before real use.

This target is for discovery and agreement, **not automatic launch approval**.
If access, consent, security or support is unresolved, continue with synthetic demos and planning rather than rushing real-data use to meet the date.

Keep spending and promises small

- Use existing laptops/phones first. Agree a modest travel/materials budget with

your team/mentor before spending; no grant or free college facility is assumed.

- Prove usefulness before major hardware purchases or company-formation spending;

verify applicable requirements before selling or making commercial commitments.

- Consider charging only after scope, actual delivery costs, permissions, taxes and

reviewed terms are clear. A later six-week pilot proposal
can formalize the agreed workflow; it is not required for an initial conversation.

- Measure whether records are easier to retrieve and follow-ups are completed.

Do not claim laboratory accuracy, toxin detection or certified feed safety.

For the wider business and technical plan, return to the
launch guide. Your first action is simply to arrange the mentor demo.
